Description: Perl Portable is a useful toolset that was created to help you work with Perl on the go. All the needed scripts, binaries, modules and other components are included. The package can be installed onto any portable storage device and, besides the Strawberry Perl distribution, it comes with support for compiling CPAN modules. The "perlrun" program is used by the Strawberry Perl distribution to compile Perl sources into binary code. It is based on the perlrun script that is bundled with the Perl distribution itself. It is not suitable for use with any other Perl distribution. You can use it, however, to run any Perl application and to create custom versions of Perl. The Perl portability tools are more suitable for use with Perl run time systems. Perl Portable is a useful toolset that was created to help you work with Perl on the go. Portable Perl distribution that provides support for building Perl modules with the Strawberry Perl distribution. It includes Perl modules, Perl extensions, Perl distribution, Perl style, CGI, HTML, HTML parsers, Tk, TT, XS, URI, XML, SQL and all the scripts needed to create and test web pages. WWW: Can I sue my ISP for abusing my ability to connect? A: In most countries this is not an option. In the UK for example, the default law is that a company can't be sued for damages because of something that is part of its service. They have certain legal liabilities but that's not the same as being a "responsible party". The US also has a similar law called the Communications Act of 1934. The Federal Communications Act of 1934 (47 U.S.C. 151 et seq.) was passed by Congress on February 18, 1934. The purpose of this act was to create a unified communications system. (source) A: In most EU countries you cannot legally be held liable for things that happen due to you supplying network connectivity to the public. Your ISP, for instance, is a company that you rent space from and has no legal obligation to prevent what their customers do. The law might be more progressive in some countries but your ISP is not in itself the liable party. In the UK you can sue them, but they will argue that your ISP isn't an "instrument of your harm" and not responsible for it. They will probably argue that they are responsible for providing your Internet access and if you used that access in a harmful manner then they aren't responsible for it. You have a few ways to deal with it: Get a lawyer to write you a letter threatening them, but it will only scare them and will cost you money. If you win, they will probably need to pay for your lawyer and the other legal fees. Get a big ISP in your country and complain to them. A few will have an obligation to do more but only because they have customers. Make an anonymous complaint to Ofcom about them. Ofcom is the organization that regulates the UK's media. The third option is probably the safest. A: It would depend on the jurisdiction and the details of the agreement between you and your ISP. In some jurisdictions there

files, without changing them Get to know the new features of the latest Perl 5.20 release. Explore the internals of Perl 5.20's code base and new language features with articles and tutorials. Perl 5.20 comes packed with new features that make it faster and easier to create dynamic websites, process e-mail and connect to databases. The release comes with a major upgrade to the Moose Object System, to be sure, but the core speedup and new features are really worth the upgrade. This is the first public beta release of Perl 5.20.0.0. If you find any bugs, please report them at the bug tracker on the perlbug site. This is just a preview, not a stable release. We recommend you use a testing distribution such as 5.20.0_1 or 5.20.0_beta1 and report any problems you find there. All distributions are available for all three platforms, as usual. You can get the source code and the release from CPAN, or on your preferred mirror. The following distributions are part of this release: NOTE: The following distributions are also available on CPAN, but are not part of this release: There are also a number of distributions which have been made available by various individuals and organisations for various purposes. If you are interested in obtaining one of these distributions, please get in touch with the relevant author. Perl 5.20.0 brings about many speedups, new language features, and significant changes to the core that provide for a more optimized perl. Lots of speedups - Perl 5.20 is more than 20% faster than Perl 5.18 on the vast majority of programs, and also offers a speedup of about 8% for the use of the B::Deparse module. New Moose XS language features - Perl 5.20 introduces a number of new language features built on Moose XS, including a new import declaration, a new import method, and new class visibility rules. Whither goto? - The goto keyword is now deprecated in all but a few cases. Whether you like it or not, you'll have to use Perl's next and
